## CLIENT SERVER COMPUTING

Introduction to Client/Server computing  
& Architecture Notes

Introduction, Basic Model, Server Types,  
Client Types, Topologies, Architecture,  
Middleware, MVC, Databases.

Notes by:  
Kamal Kishor

# 1. Introduction to Client/Server Computing

Client/Server Computing is a distributed computing model where tasks are divided between 'clients' (requesters) and 'servers' (service providers).

## • Client

A client is a computer or program that requests services.

- Example: Web browser, email client.

## • Server

A server is a powerful system that provides services.

- Example: Web server, database server.

## Key Idea

Client sends request → Server processes → Server sends response

## 2. Basic Client/Server Computing Model

### Components:

1. **Client:** User interface & request generator
2. **Server:** Processes requests
3. **Network:** Medium for communication

### Working:

- Client sends request using network
- Server processes the request
- Server sends result back to client

### Advantages:

- Centralized data,
- Better security,
- Easy maintenance,
- Scalability.

## 3. Server for Every Client Model

- Each client is assigned a dedicated server.
- No sharing between clients.

### Disadvantages: ~~X~~

- High cost
- Poor scalability
- Wastes resources

# 4. Types of Servers (Part 1)

## 4.1 File Server

- Stores files centrally.
- Clients download files.
- Example: Shared folders.

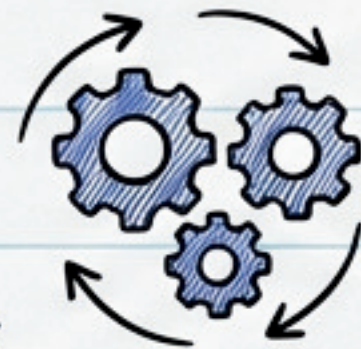

## 4.2 Print Server

- Manages printers.
- Handles print jobs from multiple clients.

## 4.3 Application Server

- Runs application logic.
- Reduces load on client.
- Example: Java EE Server.

## 4.4 Mail Server

- Manages email sending/receiving.
- Example: SMTP, POP3, IMAP.

# 4. Types of Servers (Part II)

## 4.5 Directory Services Server

- Stores user & resource information.
- Example: LDAP, Active Directory.

## 4.6 Web Server

- Delivers web pages.
- Uses HTTP/HTTPS.
- Example: Apache, Nginx.

## 4.7 Database Server

- Stores & manages databases.
- Example: MySQL, Oracle.

## 4.8 Transaction Server

- Handles transactions.
- Ensures ACID properties.
- Used in banking systems.

# 5. Client Types: Fat Client vs Thin Client

## Fat Client

- Processing done on client.
- Less dependency on server.
- Example: Desktop software.

## Thin Client

- Processing done on server.
- Client is lightweight.
- Example: Browser-based apps.

<u>Feature</u>	<u>Fat Client</u>	<u>Thin Client</u>
Processing	Client	Server
Cost	High	Low
Maintenance	Difficult	Easy

# 6. Stateless vs Stateful Servers

**Stateless Server:** No client info stored. Each request is independent.  
Example: HTTP.

**Stateful Server:** Maintains client session data. More complex.  
Example: Online banking session.

# 7. Client/Server Types & Alternatives

## 7. Client/Server Types

- ★ 7.1 Single Client / Single Server: One client connects to one server.

- ★ 7.2 Multiple Clients / Single Server: Many clients use one server. Common in real systems.

- ★ 7.3 Multiple Clients / Multiple Servers: Load distributed across servers. High scalability.

## 8. Integration with Distributed Computing

- ★ Client/Server is part of distributed systems.
- ★ Resources shared over network.
- ★ Improves performance and reliability.

## 9. Alternatives to Client/Server Systems

- ★ Peer-to-Peer (P2P)
- ★ Mainframe Computing
- ★ Cloud Computing

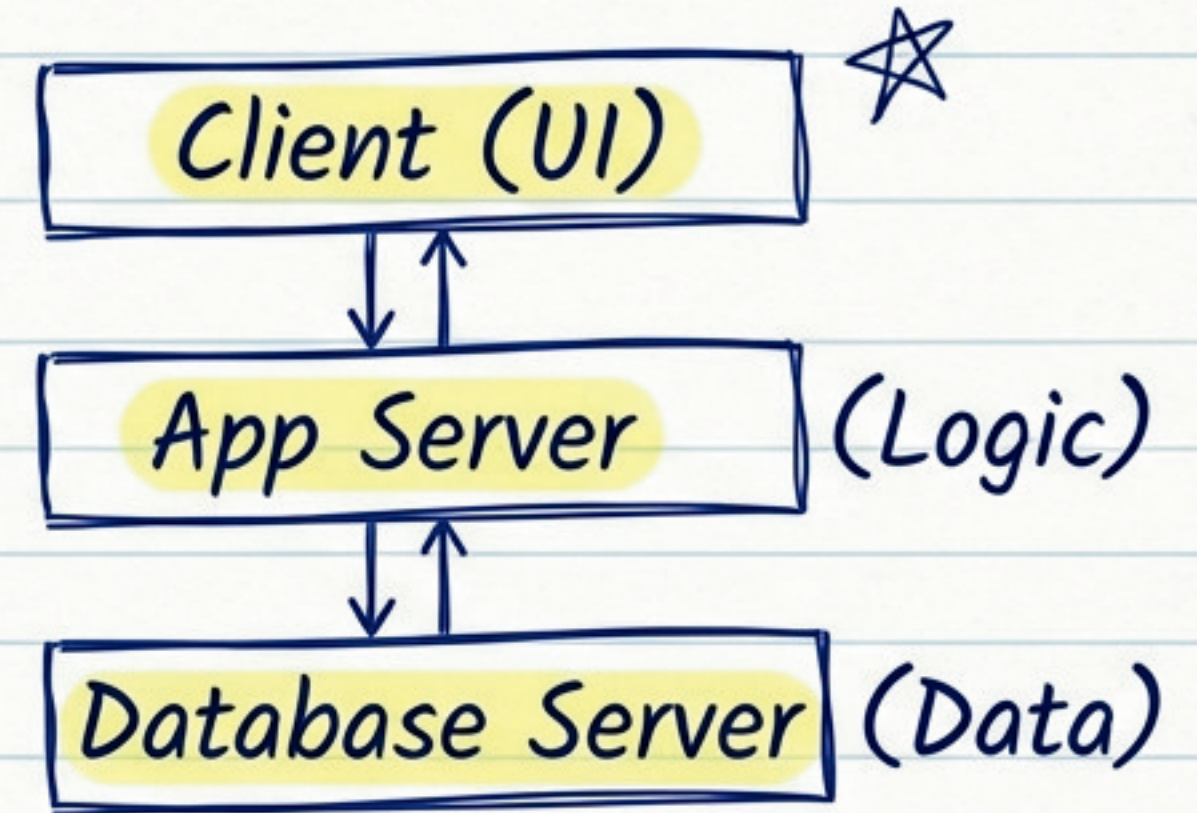

# 10. Classification of Client/Server Systems

## 10.1 Two-Tier Architecture

- Client ↔ Server.
- Client handles UI & logic.
- Server handles database.

## 10.2 Three-Tier Architecture

- ★ Advantages:
  - Better security ★
  - Easy scalability
  - Separation of concerns.

## 11. Middleware

Bridge

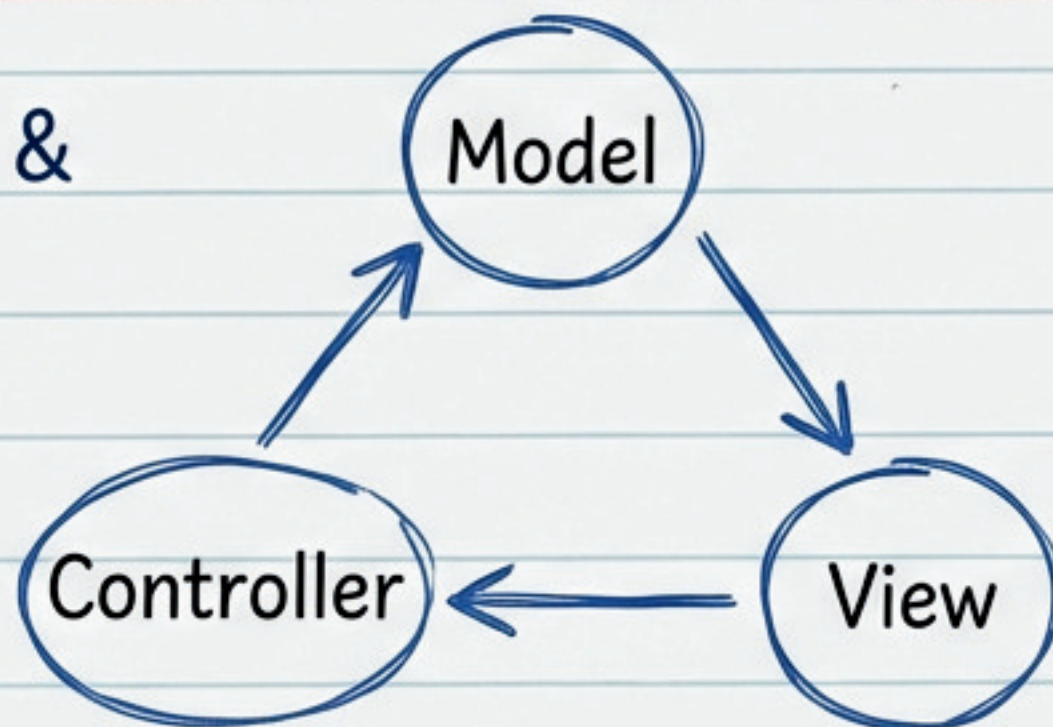

Middleware is software that acts as a **bridge** between client and server.

- **Functions:** Communication, Data translation, Security, Transaction management.
- **Examples:** RPC, CORBA, Message Queues.

## 12. MVC (Model View Controller)

- **Model:** Handles data & business logic.

- **Controller:** Handles user input.

- **View:** User interface.

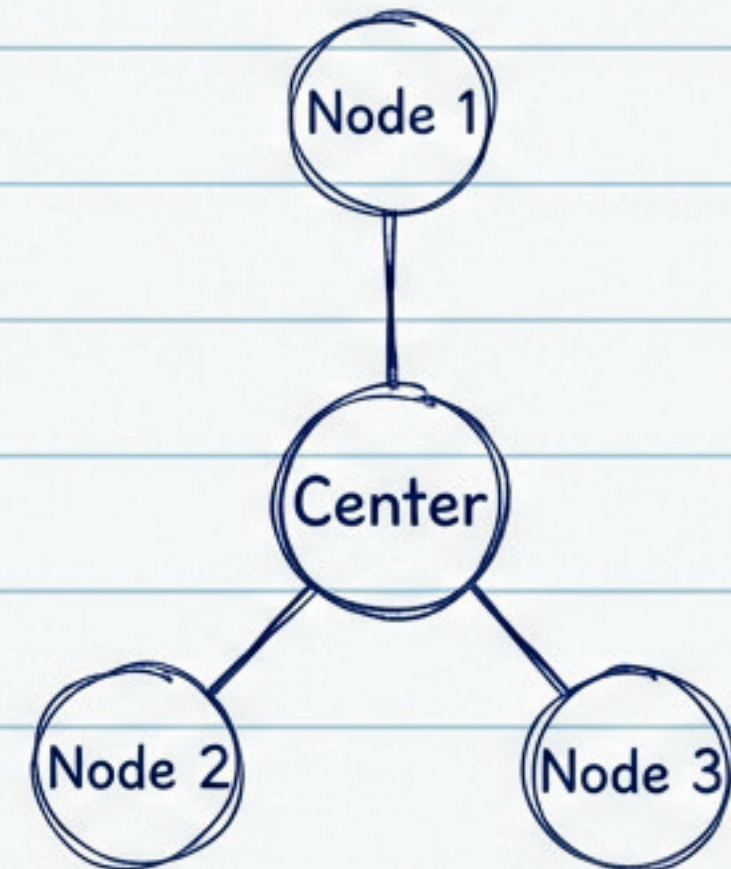

**Advantage:** Clean separation, Easy maintenance.

## 13. Principles Behind Client/Server Systems

- ✓ Scalability
- ✓ Reliability
- ✓ Interoperability
- ✓ Transparency
- ✓ Security

## 14. Client/Server Topologies

- Centralized
- Distributed
- Hybrid

## 15. Existing Client/Server Architecture

- File-based systems
- Database-based systems
- Web-based systems

## 16. Client Services

Types:

- Request for services
- Remote Procedure Call (RPC)
- Windows services
- Print services
- Remote boot services
- Utility services

## 17. Server Functionality (Detailed)

- Request handling
- Resource management
- Security enforcement
- Concurrency control
- Transaction management

## 18. Network Client/Server Technology & Databases

### Database Storage:

- Centralized DB,
- Distributed DB

### Database System Architecture:

- Single-tier,
- Two-tier,
- Three-tier

## 19. Client/Server in Respect of Databases

### Client/Server Databases

- Client sends queries.
- Server executes queries.

### Database Computing vs Mainframe (Comparison)

Feature	Client/Server	Mainframe
Cost 	Low	High
Flexibility 	High	Low

# 20. Client/Server Database Architecture

## 20.1 Process-per-Client Architecture

- One process for each client.
- High overhead.

## 20.2 Multithreaded Architecture

- Multiple clients handled by threads.
- Efficient resource usage.

## 20.3 Hybrid Architecture

- Combines both approaches.
- Best performance.

# Summary: Advantages & Disadvantages

## ✓ Advantages of Client/Server Computing

- Resource sharing
- Scalability
- Better security
- Centralized management

## ✗ Disadvantages

- Server dependency
- Network failure issues
- Initial setup cost
